

New Zealand's warmest winter on record

Temperature	Winter 2020 was New Zealand's warmest winter on record. The nationwide average temperature was 9.6°C (1.1°C above the 1981-2010 average from NIWA's seven station temperature series which begins in 1909). Temperatures across the country were generally above average (0.51 to 1.20°C above the winter average) or well above average (>1.20°C above the winter average). Several isolated locations however observed near average winter temperatures (within 0.50°C of the winter average), including Tararua, Kaikoura, and parts of Southland and Otago.
Rainfall	Rainfall totals in Northland were above normal (120-149% of the winter normal) or well above normal (>149% of the winter normal). Rainfall was below normal (50-79% of the winter normal) for western Waikato and many locations between Taihape and Wellington, and near normal (80-119% of the winter normal) for most remaining North Island locations. In the South Island, southern locations generally observed near normal winter rainfall totals including Southland, much of Otago, and the southern portion of the West Coast region. Remaining South Island locations generally observed below normal (50-79% of the winter normal) or even well below normal (<50% of the winter normal) winter rainfall totals (including the northeastern portion of Otago).
Soil moisture	At the end of winter, soil moisture levels were near normal for most of the North Island, although soils were drier than normal in parts of the Manawatu-Whanganui and Greater Wellington regions. Soil moisture levels were considerably drier than normal in eastern parts of South Canterbury and North Otago, with NIWA's New Zealand Drought Index classifying conditions as "very dry" in some areas. Near normal soil moisture levels were found for the remaining majority of the South Island.

Winter climate in the six main centres
Highlights and extreme events

Overview

Winter 2020 was New Zealand's warmest winter on record. The season was characterised by mean sea level pressures that were higher than normal over, to the east, and southwest of New Zealand, with slightly lower than normal sea level pressure northwest of the country. This pressure pattern delivered more frequent warm northeasterly winds than normal, particularly to the North Island. This pattern was associated with a developing La Niña event in the equatorial Pacific. Sea surface temperatures (SSTs) surrounding New Zealand were also warmer than average during winter, most notably during August, and this exerted a further warming influence on the country's air temperatures. Additionally, the prevalence of high pressure over the country contributed to a

sunnier than normal winter for much of the South Island and lower North Island. This combination of more frequent northeasterlies, warmer SSTs, and higher pressure over the country, along with a background influence of climate change (i.e. a long-term increase in average temperatures), resulted in widespread warm conditions during winter.

The nationwide average temperature for winter 2020 was 9.6°C (1.1°C above the 1981-2010 average from NIWA's seven station temperature series which begins in 1909), making it New Zealand's warmest winter on record, beating the previous record set in 2013 by only 0.06°C. Temperatures around the country were generally above average (i.e. 0.51 to 1.20°C above the winter average) or well above average (>1.20°C above the winter average), with only a handful of locations experiencing near average winter temperatures (within 0.50°C of the winter average). The season started and ended on a warm note with New Zealand's fifth-warmest June, and fourth-warmest August on record. Many locations achieved record or near-record high mean temperatures for the time of year during these months. During the final few days of winter, several locations observed very high daily maximum temperatures, including Timaru at 25.1 °C on 30 August, which was the 4th-equal warmest winter temperature on record for New Zealand.

Historical nation-wide winter temperature anomalies (degrees above or below the winter 1981-2010 normal) from NIWA's seven-station temperature series which begins in 1909. Winter 2020 has claimed the record of warmest winter, which was formerly held by the winter of 2013.

Rainfall patterns varied spatially month-to-month, however for winter as a whole, below normal rainfall (50-79% of the winter normal) was observed for most of the upper and eastern South Island, as well as western Waikato and many locations in the lower North Island between Taihape and Wellington. Above normal (120-149% of the winter normal) or well above normal (>149% of the winter normal) winter rainfall was observed in Northland, largely attributed to events during July and August, while near normal (80-119% of the winter normal) rainfall for winter was observed for most remaining locations across the country. A particularly noteworthy rainfall event occurred in Northland on 17 July, resulting in daily rainfall totals of 262 mm and 251 mm at Kaikohe and Whangarei. These are the highest maximum one-day rainfall amounts on record for winter at those

locations, contributing 28% and 31% of the total rainfall amounts recorded at Kaikohe and Whangarei respectively for winter 2020 as a whole. Several impacts relating to this event are summarised in the <u>highlights and extreme events</u> section.

Further Highlights:

- The highest temperature was 25.1°C, observed at Timaru on 30 August.
- The lowest temperature was -12.3°C, observed at Middlemarch on 14 June.
- The highest 1-day rainfall was 262 mm, recorded at Kaikohe on 17 July.
- The highest wind gust was 191 km/h, observed at Cape Turnagain on 23 July.
- Of the six main centres in winter 2020, Auckland was the warmest, Christchurch was the
 coolest, Tauranga was the wettest and sunniest, Dunedin was the driest, and Hamilton was
 the least sunny.

Temperature: Record-breaking warmth for many locations

The nationwide average temperature for winter 2020 was 9.6°C (1.1°C above the 1981-2010 average from NIWA's seven station temperature series which begins in 1909). This makes winter 2020 New Zealand's warmest winter on record, beating the previous record (winter 2013) by only 0.06°C. Seventeen locations observed record breaking mean winter temperatures, with an additional 53 locations ranking within their top-four warmest winters. Twenty-one locations observed record high mean maximum (i.e. daytime) temperatures, and nine locations observed record high mean minimum (i.e. night-time) temperatures, with many additional near-records observed in both categories. The most anomalously warm mean temperature for winter was observed at Farewell Spit, which was 2.8°C warmer than average. This location also observed mean maximum (i.e. daytime) temperatures that were 3.1°C above the winter average, and mean minimum (i.e. night-time) temperatures that were 2.3°C above the winter average (the largest anomalies in both categories). There were no locations that observed a record or near-record cold winter.

Rainfall: Wet in Northland, dry for many South Island locations

Winter was particularly wet for Northland, where rainfall totals were above normal (120-149% of normal) or well above normal (>149% of normal) for the season as a whole. Notably, Kaikohe observed 935 mm of rain during winter, which is 187% of the normal amount for the season, and the second highest winter total on record for that location (records there begin 1956). Whangarei also observed near-record high winter rainfall, with 810 mm observed for the season as a whole (190% of normal), the fourth-wettest winter total on record for that location. A large portion of the rainfall observed across Northland occurred during a significant rainfall event in mid-July (refer to the highlights and extreme events section for further details).

Most South Island locations north of Oamaru observed below normal (50-79% of normal) or even well below normal (<50% of normal) winter rainfall totals, with only a few setting near-record lows. Of note was Reefton, where only 54% of the normal winter rainfall amount was observed, making the winter of 2020 the second-driest on record for that location.

Record¹ or near-record winter rainfall totals were recorded at:

Location	Rainfall total (mm)	Percentage of normal	Year records began	Comments
High records or near-reco	ords			
Kaikohe	935	187	1956	2nd-highest
Whangarei	810	190	1937	4th-highest
Low records or near-reco	rds			
Reefton	291	54	1960	2nd-lowest
Arapito	410	69	1978	3rd-lowest
Waipara	92	54	1973	3rd-lowest
Dannevirke	168	59	1951	4th-lowest

¹ The rankings (1st, 2nd, 3rd etc.) in all Tables in this summary are relative to climate data from a group of nearby stations, some of which may no longer be operating. The current climate value is compared against all values from any member of the group, without any regard for homogeneity between one station's record, and another. This approach is used due to the practical limitations of performing homogeneity checks in real-time.

Winter climate in the six main centres

Mean temperatures were above average in all six centres for winter. Tauranga observed its warmest winter on record, with a mean daily temperature of 11.9°C which is 1.2°C above the long-term average. Tauranga was also among the handful of locations outside Northland which experienced above normal rainfall during winter, recording a total of 462 mm (131% of normal). Of the six main centres in winter 2020, Auckland was the warmest, Christchurch was the coolest, Tauranga was the wettest and sunniest, Dunedin was the driest, and Hamilton was the least sunny.

Winter 2020 main centre climate statistics:

Temperature			
Location	Mean temp. (°C)	Departure from normal (°C)	Comments
Aucklanda	12.4	+1.0	Above average (4 th -highest on record)
Tauranga ^b	11.9	+1.2	Above average (highest on record)
Hamilton ^c	10.2	+1.0	Above average (3 rd -highest on record)
Wellington ^d	10.3	+1.0	Above average (2 nd -highest on record)
Christchurch ^e	7.4	+0.9	Above average
Dunedin ^f	8.0	+0.9	Above average (3 rd -highest on record)
Rainfall			

Kaiiiiaii			
Location	Rainfall (mm)	% of normal	Comments

³ Missing 2 days of data

² Missing 1 day of data

⁴ Tauranga, Wellington and Christchurch record sunshine use Campbell-Stokes manual sunshine recorders, whereas Auckland, Hamilton and Dunedin record sunshine with high-precision electronic sensors.

Highlights and extreme events

This section contains information pertaining to some of the more significant highlights and extreme events that occurred during winter 2020. Note that a more detailed list of significant weather events for winter 2020 can be found in the *Highlights and extreme events* section of NIWA's monthly Climate Summaries. These monthly summaries are available online, and may be viewed at the following website: https://niwa.co.nz/climate/monthly

Temperatures

On 14 June, a heavy frost was observed in many parts of the South Island with very low overnight minimum temperatures. Between 8-9 a.m., Middlemarch got as cold as -12.3°C – New Zealand's lowest June temperature since 2015. At the same time on 15 June (8-9 a.m.), the temperature got as high as 17.0°C in Middlemarch – a remarkable one-day difference of 29.3°C. On 15 June, the temperature was as low as -8.0°C in Middlemarch between 1-2 a.m., but reached as high as 15.8°C between 4-5 a.m., a temperature change of 23.8°C in approximately three hours, which is all the more impressive given this was overnight with no solar radiation contribution to the warming.

Under the influence of a ridge of high pressure over and to the east of the South Island during the middle stages of July, an inversion developed over many parts of the South Island, bringing persistent cold temperatures which were notably cool during daylight hours. The maximum temperature at Tiwai Point (near Invercargill) on 17 July was just 2.3°C, making it the coldest July day there since records began in 1972. The temperature stayed below freezing throughout 17 July in Lauder, reaching a maximum of just -2.8°C.

During the final few days of August, a strong and warm northwesterly airflow became established over New Zealand. Dozens of locations observed record or near-record high daily maximum and minimum air temperatures during this period. Most notably, Timaru recorded 25.1°C on 30 August. This was the city's highest temperature on record for winter. This was additionally New Zealand's equal 4th-highest winter temperature on record overall. Timaru observed another warm day on 31 August, when the maximum temperature reached 23.0°C.

The highest winter temperature was 25.1°C, observed at Timaru on 30 August. The lowest temperature was -12.3°C, observed at Middlemarch on 14 June.

Record or near-record daily maximum air temperatures for winter were recorded at:

Location	Extreme maximum (°C)	Date of extreme temperature	Year records began	Comments
High records or near-records

Rain and slips

On 18 June, heavy rain in Wellington caused surface flooding, and several roads were closed due to slips. Parts of Oakura (Taranaki) were flooded when the Oakura River burst its banks after heavy overnight rain.

On 21 June, heavy rain caused surface flooding in parts of the Coromandel Peninsula. The Tairua River Bridge (SH25) was closed due to flooding, and a small slip was reported on SH25A over the Coromandel Range. Farther south, SH2 was down to one lane at Waioeka Gorge (between Opotiki and Gisborne) due to a slip.

On 25 June, heavy rain fell across Auckland and the Coromandel Peninsula, causing surface flooding on many roads and farm properties. State Highway 25 in the Coromandel was closed in several places due to flooding. The rainfall was welcomed after Auckland had observed many consecutive months without significant rain, resulting in depleted water storage levels in their dams. It was the first time Auckland had recorded 50 mm or more of rain in a day since October 2019.

On 2 July, heavy rain caused surface flooding in parts of Masterton, with slips reported on rural roads near Castlepoint.

On 17 July, very heavy rain and thunderstorms hammered much of Northland. Civil Defence welfare centres were activated as people were forced to leave their homes due to flooding. Approximately 65 homes were evacuated, and four of these homes were left uninhabitable due to damage sustained by floodwaters. Police advised against non-essential travel throughout Northland due to widespread and considerable flooding, particularly about Whangarei. Whangarei (Airport) observed 50.8 mm of rain in the hour between 9-10 p.m., which was the city's second-highest hourly rainfall total for all months on record (records began 1978). Several road closures resulted from the heavy rain and floods, including SH1 between Ohaeawai and Kawakawa. Heavy rain also fell over the Coromandel Peninsula causing widespread flooding and road closures.

On 18 July, heavy rain caused flash flooding and slips in the Gisborne region. Three families were evacuated from Mangatokerau (north of Gisborne), and SH35 was closed from Tolaga Bay to Makarika Road (just south of Ruatoria). The beach at Tolaga Bay was blanketed in forestry slash which had been washed down from inland areas by rivers.

On 21 July, heavy rain caused surface flooding on some Queenstown roads, with rockfalls reported on the Queenstown-Glenorchy road, the Crown Range road and SH6 between Frankton and Kingston.

On 18 August, a period of heavy rain occurred in parts of Northland, with 69 mm recorded at Kerikeri. While the rainfall totals observed were not especially high, they were cause for concern as much of Northland soils were still saturated by heavy rain and flooding that occurred during the previous month.

The highest 1-day rainfall was 262 mm, recorded at Kaikohe on 17 July.

Record or near record winter extreme 1-day rainfall totals were recorded at:

Location	Extreme 1- day rainfall (mm)	Date of extreme rainfall	Year records began	Comments
Kaikohe	262	Jul-17th	1956	Highest
Whangarei	251	Jul-17th	1943	Highest

Mcqueens Valley	64	Jun-28th	1947	3rd-highest
Karangahake Gorge	120	Jun-25th	1981	4th-highest
Glenledi	49	Jul-7th	1984	4th-highest

Wind

On 26 June, three separate small tornadoes were reported in Northland. In Whangarei, six boats were blown off their cradles in the *Norsand Boatyard*. In Mata (south of Whangarei), trees were toppled and iron from a farm shed strewn among a nearby stand of trees. Farther north in Oakura, trees were also toppled by a tornado. A tornado also struck Dairy Flat (north of Auckland), with one house suffering considerable damage including having the roof torn off. Nearby areas saw mature trees torn down with reports of miscellaneous property damage.

On 27 June, tornadoes were reported in Auckland and Papamoa. Multiple buildings and roofs were damaged in East Tamaki (south Auckland) and trees were brought down. In Papamoa a local reported seeing roof tiles, gutters and tv dishes ripped off houses.

On 2 July, strong southerly winds brought down several trees in the Wellington suburbs of Khandallah, Karori and Vogeltown. Wellington's *East by West* ferry services were cancelled due to large swells driven by the strong winds, and Cook Straight ferry crossings were also cancelled. The strong winds blew down power lines in Wainuiomata, while a tree was brought down onto power lines in Naenae. Farther north, 90 customers near Martinborough were without power due to downed power lines.

On 16 July, trees were felled by strong winds on the Hauraki Plains, with arching power lines reported in Onewhero. Approximately 150 homes were without power, including 86 homes in Te Aroha.

On 20 August, a tornado was reported in Pukenui (Northland). A launch blown off its blocks, and one house lost half of its roof. Additional damage was reported to include trees, a large shed and a trampoline was sent tumbling along the road.

The highest wind gust was 191 km/h, observed at Cape Turnagain on 23 July.

Record or near record winter extreme wind gusts were recorded at:

Location	Extreme wind gust (km/h)	Date of extreme gust	Year records began	Comments
Secretary Island	133	Jun-15th	1994	Highest
Paeroa	100	Jul-16th	1991	3rd-highest
Puysegur Point	148	Jun-15th	1986	Equal 3rd-highest
Hanmer Forest	109	Jun-25th	1995	4th-highest
Pukekohe	76	Jul-22nd	1986	Equal 4th-highest

Snow and ice

On 6 June, snow fell over inland parts of Canterbury particularly about the Mackenzie Country. The snowfall closed several roads including Burkes Pass (SH8), and SH80 between Aoraki/Mt Cook and Pukaki.

On 22 June, black ice contributed to several vehicle accidents in the Mackenzie Basin, although no injuries were reported.

On 2 July, snow fell to low elevations in the central North Island. Several roads were closed due to snow, including the Desert Road (SH1), SH46 from Rangipo to the SH47 junction, and SH47 from National Park to the SH41 junction near Turangi.

On 23 July, snow settled down to around 200 metres above sea level in southeastern parts of the South Island, especially near Balclutha. Snow was also reported in the hill suburbs of Dunedin. The Southland District Council urged extreme caution on roads in the southeast of the province, especially around Edendale, Wyndham, Glenham and the Catlins due to slushy road conditions. A bus rolled onto its side near Glenham (south-east of Gore), with the driver taken to hospital. Snow fell to around 400 metres above sea level near Queenstown. Chains were required on vehicles travelling over the Crown Range Road. The Milford Road (SH94) was closed due to heavy snow.

August 2020 was notable for a relative lack of snow in many of New Zealand's mountain areas. Towards the end of August, snow depths were approximately half of usual for the time of year at several NIWA Snow and Ice Monitoring sites, including Mt Philistine (Arthur's Pass National Park), Mueller Hut (Aoraki/ Mount Cook National Park) and Castle Mount (Fiordland National Park). Several ski areas were impacted by the lack of snow, including Temple Basin (Arthur's Pass) which announced it wouldn't open at all for the season.

Lightning and hail

On 4 June, approximately 20 lightning strikes were recorded about Nelson and Tasman. The lightning was associated with a thunderstorm that passed over during the evening hours.

On 25 June, approximately 20 lightning strikes were recorded over Auckland between 5-6 a.m.

On 17 July, approximately 500 lightning strikes were recorded near Northland. They were associated with thunderstorms that delivered heavy downpours of rain to the region.

Cloud and fog

On 23 June, heavy fog in Wellington caused flight disruptions and prompted warnings for motorists to take extra care. The fog lasted until the early afternoon.

Low cloud persisted in many inland basins of the South Island during the second week of the school holidays (13-19 July). The cloud was trapped under an inversion, resulting in consecutive days without sunshine in areas including Wanaka, Cromwell, Alexandra and the Mackenzie Basin. Cold air was trapped near the valley floors by the inversion, and combined with the humid air to create hoar frost (see example picture below). In many parts, daytime temperatures barely rose above freezing (0°C).

On 16 July, three flights were unable to land at Invercargill Airport due to fog.

On 4 August, fog at Hawke's Bay Airport affected several commercial flights, with one arriving plane forced to return to Auckland.

Climate Scientist, NIWA Auckland Tel. 09 375 4502

Winter 2020 temperature expressed as a deviation from the long-term winter average (1981-2010).

It was a New Zealand's warmest winter on record. Most locations experienced temperatures that were above or well above average, with many observing recordbreaking warmth.

Farewell Spit was the most anomalously warm location, with mean winter temperatures that were 2.8°C above average.
